

The Importance of a Healthy G.I. Tract and the Essential Role of Probiotics

A healthy pet starts with proper digestion and a healthy digestive tract. Many factors upset the delicate balance of micro-flora in a pet's gastrointestinal system, which can lead to several unfavorable outcomes. Some of the many important roles probiotics have in establishing and maintaining this critical digestive balance include prevention of the growth of undesirable microorganisms, helping to maintain healthy micro flora in your animal's gut, assisting in digestion, and helping to prevent gas, bloating and bad breath. Supporting the digestive system is essential for healthy intestines, protection against disease, improved digestion and overall health. One great way to support the digestive system is to introduce non-dairy, beneficial bacteria - also known as probiotics. Probiotics support and enhance immune system function while helping promote regularity.

Common G.I. Stressors

» Stress:

Pets are impacted by stress and changes in routine. Traveling and boarding can cause anxiety in pets which can result in G.I. upset.

» Medicine:

Antibiotics, NSAIDs and other medications may interrupt the intestinal balance in your pet's G.I. tract.

» Environment:

Toxins and bacteria from the environment can cause G.I. upset in your pets.

» Diet:

Changes in diet, access to garbage and table scraps are common sources of G.I. upset for dogs and cats.

Other VetriScience® Products for G.I. Support:

- » Acetylator™ Capsules
- » Arabinogalactan Powder

100% Satisfaction Guarantee
